

## Advance Devops Lab 12

**Aim:** To create a Lambda function which will log "An Image has been added" once you add an object to a specific bucket in S3

### Theory:

**Objective:** To create a serverless Lambda function that triggers whenever an object is added to a specific S3 bucket and logs a message indicating that an image has been added.

### Prerequisites:

- An AWS account with necessary permissions to create Lambda functions and access S3 buckets.
- An S3 bucket created and configured.

### Steps:

#### 1. Create an S3 Bucket:

- Log in to your AWS Management Console.
- Navigate to the S3 service.
- Click on "Create bucket".
- Provide a unique bucket name and select your desired region.
- Configure any necessary permissions or tags.
- Click "Create bucket".

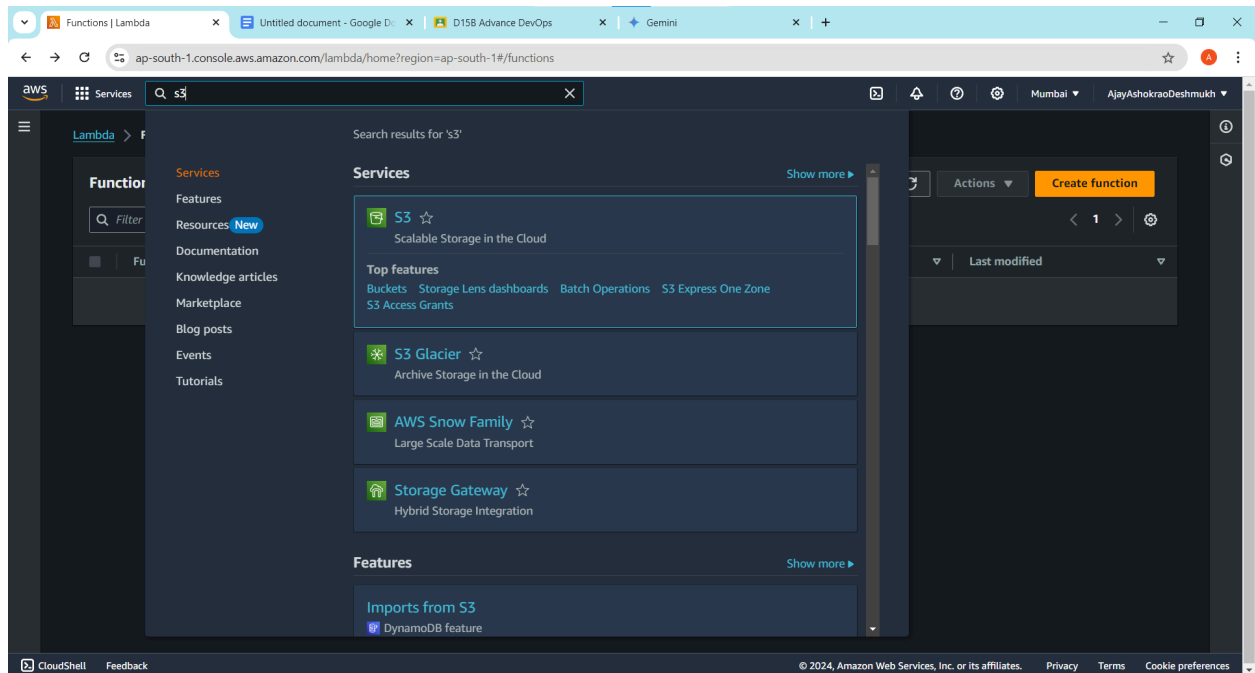

#### 2. Create a Lambda Function:

- Navigate to the Lambda service.
- Click "Create function".
- Choose "Author from scratch".
- Provide a function name and select your desired runtime (e.g., Python 3.9).
- Click "Create function".

### 3. Configure Trigger:

- In the "Triggers" tab, click "Add trigger".
- Select "S3" as the event source.
- Choose the S3 bucket you created earlier.
- Select the desired event type (e.g., "Object Created").
- Click "Add".

Storage

# Amazon S3

Store and retrieve any amount of data from anywhere

Amazon S3 is an object storage service that offers industry-leading scalability, data availability, security, and performance.

## Create a bucket

Every object in S3 is stored in a bucket. To upload files and folders to S3, you'll need to create a bucket where the objects will be stored.

Create bucket

## How it works

Introduction to Amazon S3

## Pricing

With S3, there are no minimum fees. You only pay for what you use. Prices are based on the location of your S3 bucket.

Amazon S3 > Buckets > Create bucket

## Create bucket

Buckets are containers for data stored in S3.

### General configuration

AWS Region  
Asia Pacific (Mumbai) ap-south-1

Bucket name [Info](#)  
my-image-bucket-ajay

Bucket name must be unique within the global namespace and follow the bucket naming rules. [See rules for bucket naming](#)

Copy settings from existing bucket - optional  
Only the bucket settings in the following configuration are copied.

Choose bucket

Format: s3://bucket/prefix

### Object Ownership [Info](#)

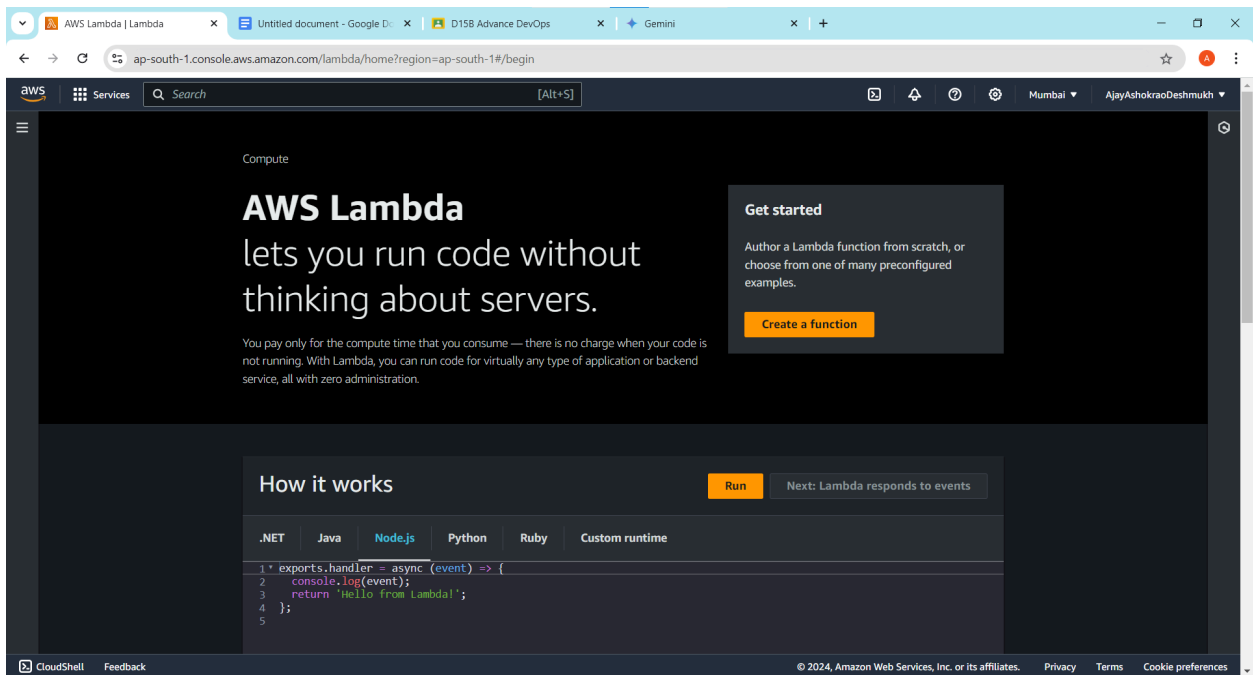

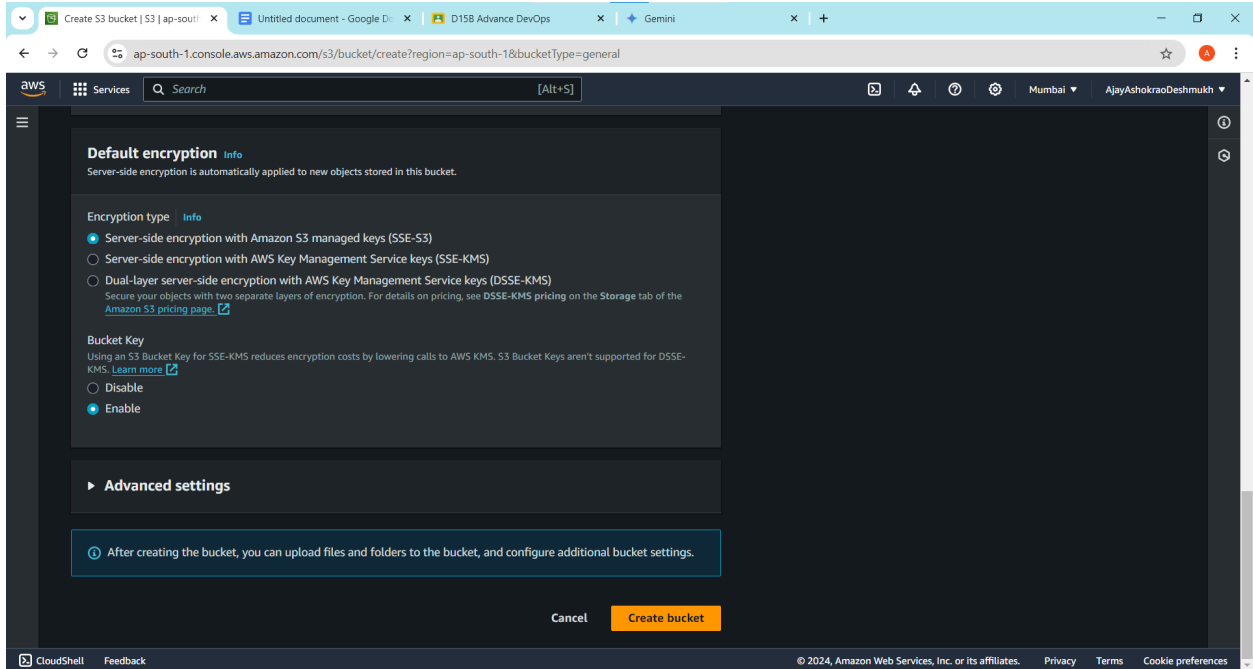

Control ownership of objects written to this bucket from other AWS accounts and the use of access control lists (ACLs). Object ownership determines who can specify access to objects.

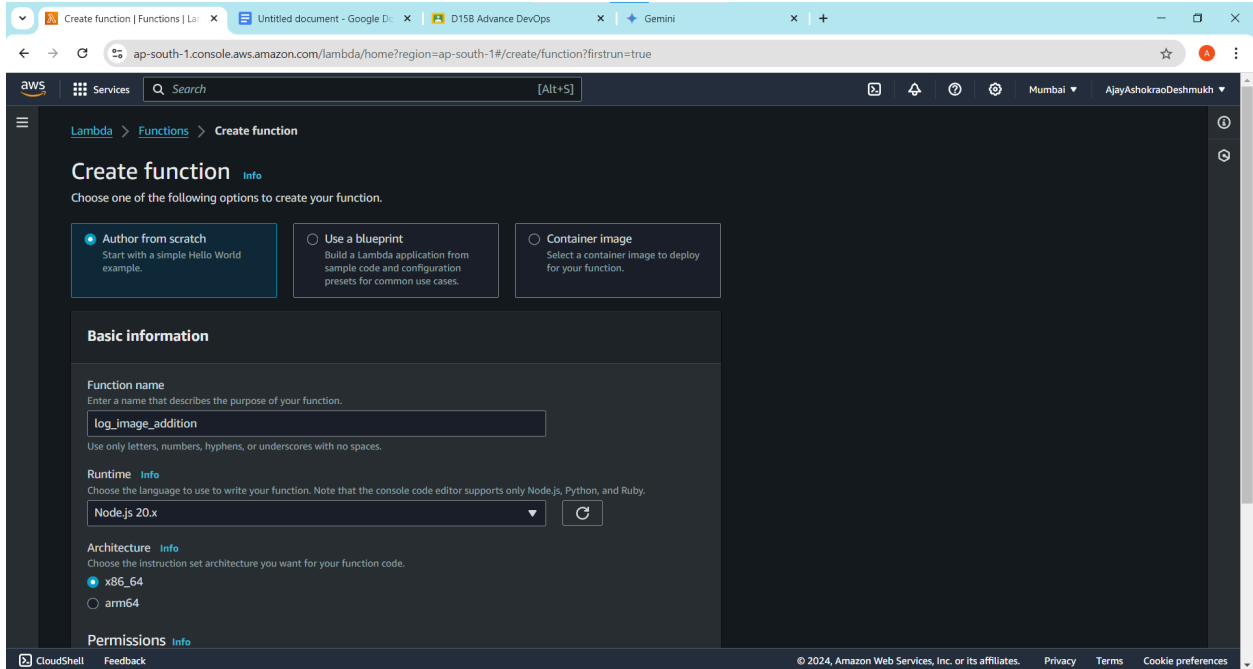

☒ ACLs disabled (recommended)  
All objects in this bucket are owned by this account.

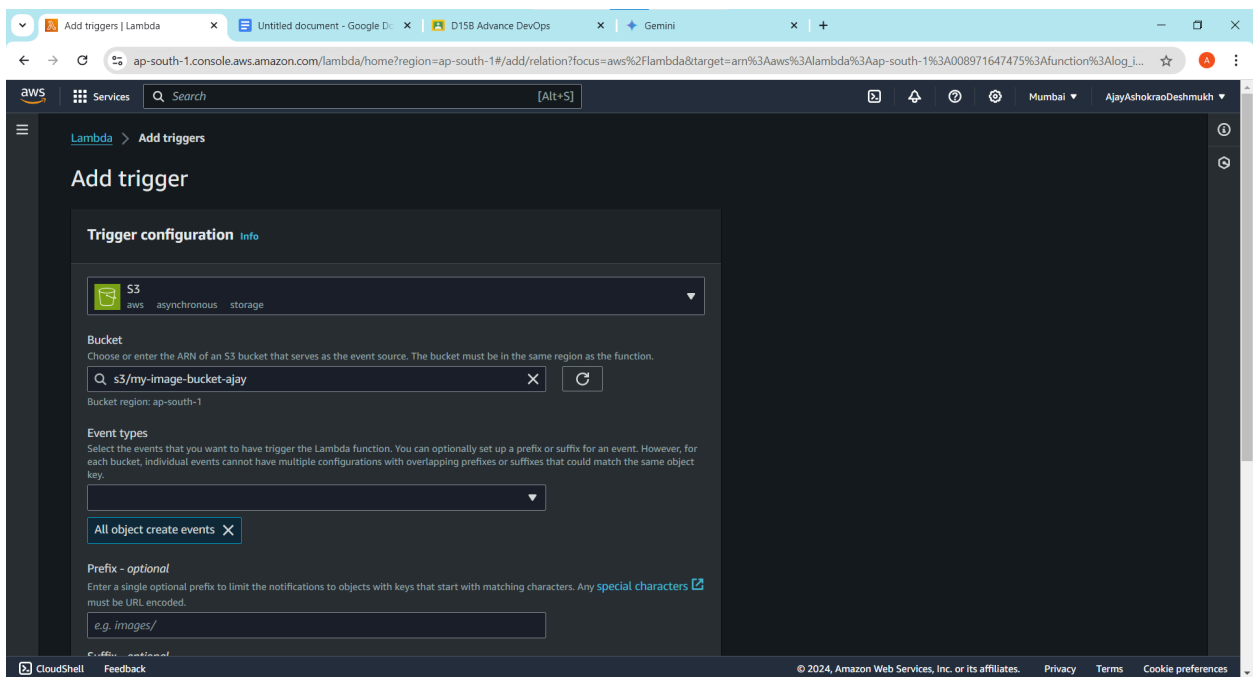

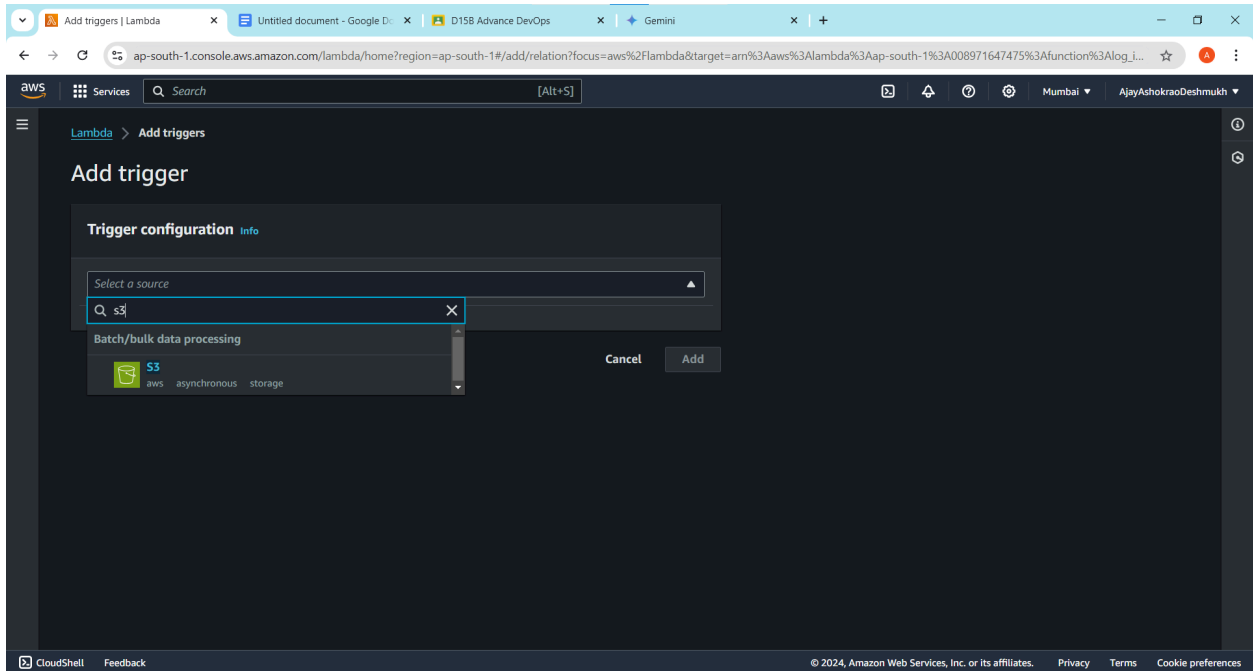

☐ ACLs enabled  
Objects in this bucket can be owned by other AWS

## Write Lambda Function Code:

```
const AWS = require('aws-sdk');

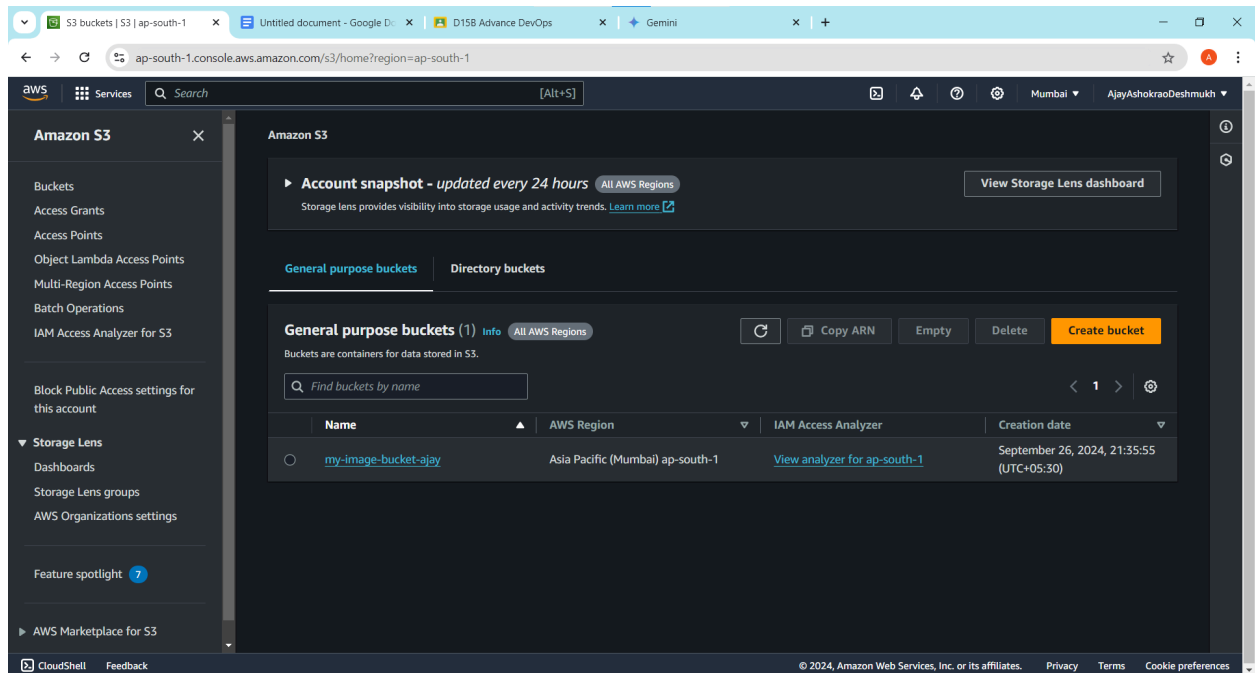

exports.handler = async (event) => {
  const s3 = new AWS.S3();

  const bucketName = event.Records[0].s3.bucket.name;
  const key = event.Records[0].s3.object.key;

  try {
    await s3.getObject({ Bucket: bucketName, Key: key }).promise();
    console.log(`Image added to S3: ${bucketName}/${key}`);
  } catch (err) {
    console.error(`Error processing image: ${err}`);
  }
};
```
