

Experiment No 4

Name: Ajay Deshmukh

Roll No: 12

Div: D15B

AIM: To install Kubectl and execute Kubectl commands to manage the Kubernetes cluster and deploy Your First Kubernetes Application.

- Running the application on the cluster

kubectl create deployment nginx --image=nginx

```
ubuntu@master:~$ kubectl create deployment nginx --image=nginx
deployment.apps/nginx created
ubuntu@master:~$
```

- Verifying the deployment using command

kubectl get deployments

```
ubuntu@master:~$ kubectl get deployments
NAME      READY   UP-TO-DATE   AVAILABLE   AGE
nginx     1/1     1            1           47s
ubuntu@master:~$
```

- Run the following command to create a service named nginx that will expose the app publicly.

kubectl expose deploy nginx --port 80 --target-port 80 --type NodePort

```
ubuntu@master:~$ kubectl expose deploy nginx --port 80 --target-port 80 --type NodePort
service/nginx exposed
ubuntu@master:~$
```

- Run this command to see the summary of the service and ports exposed.

kubectl get services

```
ubuntu@master:~$ kubectl get services
NAME         TYPE        CLUSTER-IP   EXTERNAL-IP   PORT(S)          AGE
kubernetes   ClusterIP   10.96.0.1    <none>        443/TCP          4d14h
nginx        NodePort    10.103.96.233 <none>        80:30816/TCP     67s
ubuntu@master:~$
```

- Add the port which is displayed i.e 30816 (will differ for each device) in the inbound rules of the security group of the worker.

Inbound rules (2)							
<input type="text" value="Filter security group rules"/>							
<input type="checkbox"/>	Name	Security group rule...	IP version	Type	Protocol	Port range	
<input type="checkbox"/>	-	sgr-067c4ec19a6dc863c	IPv4	Custom TCP	TCP	30816	
<input type="checkbox"/>	-	sgr-043a60f4b25fe2c26	IPv4	All traffic	All	All	

- We can verify that the nginx page is accessible on all nodes using curl command(Worker)

1. sudo su

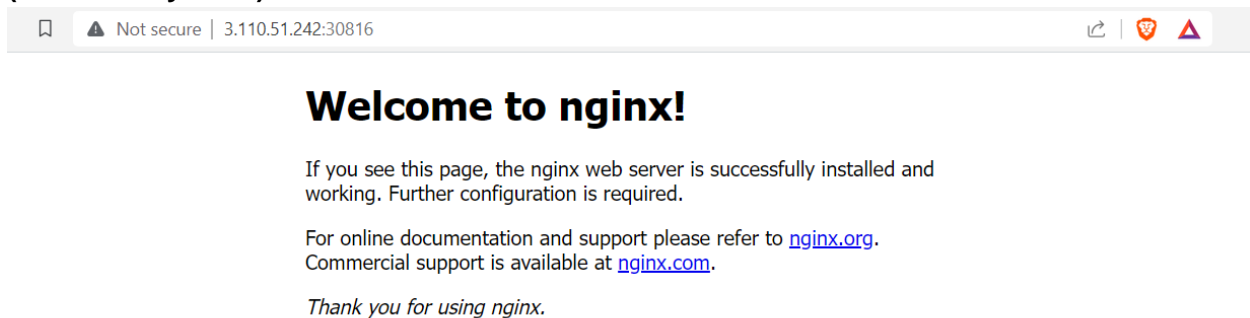

2. curl worker:30816

```
ubuntu@worker:~$ sudo su
root@worker:/home/ubuntu# curl worker:30816
<!DOCTYPE html>
<html>
<head>
<title>Welcome to nginx!</title>
<style>
html { color-scheme: light dark; }
body { width: 35em; margin: 0 auto;
font-family: Tahoma, Verdana, Arial, sans-serif; }
</style>
</head>
<body>
<h1>Welcome to nginx!</h1>
<p>If you see this page, the nginx web server is successfully installed and
working. Further configuration is required.</p>

<p>For online documentation and support please refer to
<a href="http://nginx.org/">nginx.org</a>.<br/>
Commercial support is available at
<a href="http://nginx.com/">nginx.com</a>.</p>

<p><em>Thank you for using nginx.</em></p>
</body>
</html>
root@worker:/home/ubuntu#
```

Open a new tab in browser and paste the public IP address followed by :port number (30816 in my case)

Conclusion:

Thus, we have studied and implemented how to install Kubectl and execute Kubectl commands to manage the Kubernetes cluster and deploy.
